### Purpose

To formulate bovine serum albumin (BSA) adsorbed poly(glycerol adipate-co- $\omega$ -pentadecalactone), PGA-co-PDL nanoparticles (NPs) within L-leucine microparticle carriers for dry powder inhalation.

### Methods

Nanoparticles were prepared by oil-in-water (O/W) single emulsion solvent evaporation method. Particle size and polydispersity index (PDI) were characterised. BSA was adsorbed onto NPs at three different ratios, NP:BSA (100:4, 100:10 and 100:20) at room temperature. The NPs were spray-dried in aqueous suspension of L-leucine (1:1.5) using a Büchi 290 mini-spray dryer. The resultant nanocomposite microparticles (NCMPs) were characterised for toxicity (MTT assay), aerosolization (Next Generation Impactor) and in vitro release study.

### Results

NPs of size  $128.50 \pm 6.57$  nm and PDI  $0.07 \pm 0.03$  suitable for targeting lung dendritic cells were produced. BSA adsorption for 1 h resulted in  $10.23 \pm 1.87$   $\mu$ g of protein per mg of NPs. Spray-drying in the presence of L-leucine resulted in NCMPs with  $42.35 \pm 3.17\%$  yield. In-vitro release study at 37°C for 48 h showed an initial burst release of  $30.15 \pm 2.33\%$  with  $95.15 \pm 1.08\%$  over 48 h. Aerosolization studies indicated fine particle fraction (FPF %)  $< 4.6$   $\mu$ m as  $76.49 \pm 6.26\%$  and mass median aerodynamic diameter (MMAD) of  $1.21 \pm 0.67$   $\mu$ m. The cell viability was  $106.04 \pm 21.14\%$  16HBE cell line with L-leucine based NCMPs at 1.25 mg/ml concentration after 24 h treatment.

### Conclusion

The results suggest that PGA-co-PDL/L-leu NCMPs may be a promising carrier for pulmonary vaccine delivery due to excellent release profile and aerosolisation behaviour.
